

Earth and its Resources...

Taking Responsibility

We are very aware of our long term responsibility to the planet and are doing everything possible to improve our contribution to this cause. We have chosen materials that will genuinely last a lifetime and have avoided producing the steel and glass lined units favoured by other manufacturers which typically offer a much reduced life expectancy.

Duplex stainless steel is extremely environmentally friendly. As a material it is 100% recyclable in fact over 90% of new stainless steel comes from old re-melted stainless steel. Stainless steel will go on to complete full life cycles indefinitely.

The performance of the unit with its "coil within a coil" gives fast recovery to 100% of the water content of the unit and not just part volumes like many on the market. Link this with our 50mm CFC/HCFC free (ODP Zero) foam injection lagging which gives maximum heat retention and you have a range that is very efficient and will save money on fuel bills.

Being Committed

Our commitment goes much further than just the present, as we are constantly developing new products in the same vein. These products go towards developing renewable energy resources such as solar, wind and geothermic power which we can utilise with our high recovery twin coiled units.

Continually Evolving

All in all we take environmental issues very seriously when others just pay it lip service, and we will continue to improve and develop our processes and products to keep our self-imposed high standards in this
