

ULTRASTEEL
The Mainsbooster System

Staggering Performance - Anywhere!

Copperform are now in a position to offer a cure for the ever-increasing problem in domestic and commercial applications of low pressures and poor flow rates. This makes mainspressure units a bad choice in certain areas as the water board only have an obligation to supply water to the perimeter of a building at 1 bar and a flow rate of 9 litres per minute. By adding one of our Mainsbooster sets, it is now possible to provide quite staggering performance to all outlets in the building.

The Mainsbooster system utilises the tried and tested technology of the unvented cylinder. However, by using an accumulator, you have very simply created a store of water at mains pressure for use at all your outlets. The Mainsbooster will also take advantage of the pressure fluctuations within the mains pipework and store water at the maximum pressure available. The system is simple and flexible and can be installed in any application.

Models soon to be released will also be able to generate pressure via the inclusion of a small pump, so even sites with pressure below 1 bar will be able to benefit from outlet pressures of 2-3 bar and beyond if required.
